WARNING**Lethal voltage and fire ignition hazard**

The non-insulated high voltages that are present when operating this product, constitute a risk of electric shock, personal injury, death and/or ignition of fire.

This product is intended for evaluation purposes only. It shall be operated in a designated test area by personnel qualified according to local requirements and labor laws to work with non-insulated mains voltages and high-voltage circuits. This product shall never be operated unattended.

1. Introduction

This user manual describes the operation of the SSL2109ADB1106 demo board featuring the SSL LED driver SSL2109A in a 230 V/7 W isolated flyback converter application.

The SSL2109ADB1106 demo board is designed for driving a 3-LED string load.

The PCB dimensions is compatible with GU10 form factors used in SSL applications

The demo board provides a simple and effective solution having a power factor of 0.7 and efficiency up to 85 % for SSL applications.

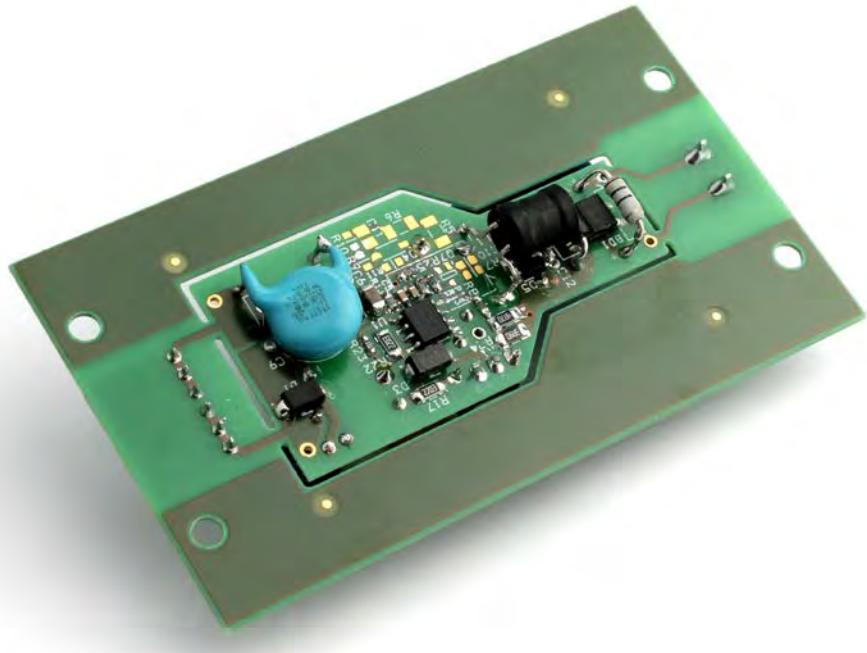

1.1 Features of the application

- GU10 form factor compatibility
- Open LED and short circuit LED string protection
- OverCurrent protection (OCP) and OverTemperature protection (OTP)
- Power factor = 0.7
- Efficiency up to 85 %
- Compliant with IEC61000-3-2 harmonics standard

The assembled top and bottom board views are shown in [Fig. 1](#) with the board dimensions in [Fig. 3](#). The board dimensions allow enough headroom with GU10 lamps.

b. Bottom view

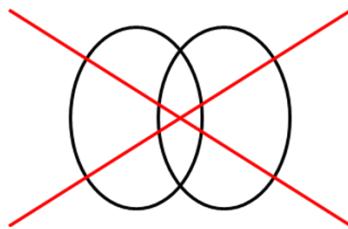

Fig 1. SSL2109ADB1106 230 V/7 W GU10 demo board

2. Safety

The board is connected to mains voltage. Avoid touching the demo board while it is connected to the mains voltage. An isolated housing is obligatory when used in uncontrolled, non-laboratory environments. Galvanic isolation of the mains phase using a variable transformer is always recommended.

3. Specifications

Table 1. Specifications of the SSL2109ADB1106

Symbol	Parameter	Value
V_{mains}	AC mains supply voltage	230 V; $\pm 10\%$
P_{in}	input power	7.4 W at nominal $V_{\text{mains}} = 230$ V
P_{out}	output power	6.2 W
V_{LED}	output voltage (LED voltage)	8 V to 14 V with nominal $V_{\text{LED}} = 10.8$ V
I_{LED}	output current (LED current)	575 mA
I_{ripple}	output ripple current	45 mA (p-p)
$\Delta I_{\text{LED}} / \Delta V_{\text{mains}}$	line regulation	1 mA/V ($\pm 3.5\% I_{\text{LED}}$ at $\pm 10\% V_{\text{mains}}$ variation)
$\Delta I_{\text{LED}} / \Delta V_{\text{LED}}$	load regulation	1.5 mA/V ($\pm 0.2\% I_{\text{LED}}$ at $\pm 10\% V_{\text{LED}}$ variation)
η	efficiency	84 %
PF	power factor	0.7
f_{sw}	total harmonic distortion	90 kHz

4. Functional description

4.1 Input filtering

A differential mode π filter is implemented to reduce differential mode noise originating from the High-frequency (HF) switching currents/voltages in the primary of the converter from returning to the mains. This noise must be kept to a minimum by:

- Small primary current loop (C2 to pin 5 of T1, pin 3 of T1 to drain of external MOSFET Q5, ground return from sense resistors R1, R24, R26 to C2 ground)
- Snubber components D3, R17, C8 closely parallel to pins 5 and 3 of T1
- Track length from pin 3 of T1 to drain of external MOSFET to be small in order to reduce capacitance to surroundings

For this 7 W application, C2 must be chosen sufficiently large to act as a buffer for the HF current flowing in the primary where a value of 100 nF for C2 is sufficient.

4.2 PF adjustment

PF adjustment is realized with a RC circuit after the rectifier comprising of R14 and C7. For 7 W, optimum values of $C7 = 1 \mu\text{F}$, $R14 = 510 \Omega$ result in $\text{PF} = 0.7$ and 0.5 W loss. A diode D5 prevents the voltage across R14 from going negative.

4.3 RCD clamp

Leakage inductance of the transformer is in series with primary inductance and the drain of MOSFET Q5. This leakage inductance together with the parasitic capacitance across the drain source of Q5 causes HF ringing when Q5 switches off. If the leakage is not minimized the voltage at the drain reaches high voltage levels which can damage Q5 if voltage levels exceed the maximum allowable level.

An RCD clamp (R17, C8 and D3) prevents the voltage on the drain of Q5 exceeding the maximum drain voltage when Q5 switches off.

4.4 Supply voltage

The supply voltage of the SSL2109A is achieved using an auxiliary winding. As further advantages, the auxiliary winding provides, via a resistor R25 on its underwinding, both a simple solution for improved load regulation using R12 and open-circuit protection (OCP) via the NTC pin using R13.

4.4.1 Open circuit protection

If no LED string is connected to the converter output, the voltage can quickly exceed the maximum rating of the output capacitor C3.

The underwinding of the auxiliary is connected to resistor R25 to prevent this. The voltage across R25 decreases as the output voltage increases. Consequently, the voltage at the NTC pin decreases once the current through R13 exceeds the internal current of the NTC pin. When the NTC voltage drops below 0.35 V then the SSL2109A switches off.

An external 18 V Zener diode is included at the VCC pin to prevent that the voltage exceeds 20 V at the VCC pin for this no LED string situation.

4.4.2 Short circuit

When the LED terminals are shorted, the SSL2109A defaults to its maximum

demagnetization time of 36 µs. This prevents that the inductor current ramps up to an excessively large value while the input power is limited and the SSL2109A enters OPS protection (latched) mode.

Remark:

Do not try to short-circuit the LED output while the circuit is powered or without discharging C3. The short-circuit protection is intended for zero-hour short circuit protection (so a short circuit during first assembly before power is applied).

5. Demo board connections

The SSL2109ADB1106 demo board is supplied with a 230 V, 50 Hz mains supply where the board connection is shown in [Fig 4](#).

Table 2. Input and output connections

Connector	Function	Remark
L	AC MainsL	line wire solder connection on small board
N	AC MainsN	neutral wire solder connection on small board
+	LED anode	positive LED wire solder connection on small board
-	LED cathode	negative LED wire solder connection on small board
X5	AC mains input	AC mains in terminal block
X6	LED load output	LED connector 6-way female for Silergy LED load

Remarks:

Make all connections with the input mains supply switched off.

Use a protective shield over application and never touch the board when measuring or testing.

Connections and testing:

- Connect 3-LED string load to the SSL2109ADB1106 together with power meters at both inputs and outputs.
- Connect V_{mains} (230 V (AC)/50 Hz) using an isolating transformer (initially set to 0 V) to the input connection points of the flyback converter. Alternatively, use an AC power supply with limited output current capability (for example 200 mA).
- Increase V_{mains} to 230 V (AC) and measure the different parameters as shown in [Table 3](#).

Table 3. Input /output parameters SSL2109ADB1106

V_{mains} (V)	I_{in} (mA)	PF	P_{in} (W)	V_{LED} (V)	I_{LED} (mA)	P_{out} (W)	η
230	47	0.7	7.4	10.8	575	6.2	0.84
